Amendment Dated: September 12, 2006

Reply to Office Action Mailed: June 12, 2006 Attorney Docket No.: 056207.50307C1

Amendments to the Claims:

The listing of claims will replace all prior versions, and listings, of claims

in the application:

<u>Listing of Claims</u>:

Claims 1-15 (canceled).

Claim 16 (currently amended): A semiconductor device according to

elaim 15, comprising:

an embedded insulation layer formed in a semiconductor substrate;

a plurality of power semiconductor transistors formed on said

semiconductor substrate;

a trench isolating between said plurality of power semiconductor

transistors formed on said semiconductor substrate on said embedded insulation

layer, whereby said plurality of power semiconductor transistors are individually

isolated from each other and, isolated from any other semiconductor transistors;

an isolator insulating and driving control electrodes of said power

semiconductor transistors and including capacitive coupling provided for

transmitting signals between said plurality of power semiconductors transistors;

Attorney Docket No.: 056207.50307C1

wherein at least two of said plurality of power semiconductor transistors

are each connected to each other in series; and

a drive circuit for driving a control electrode of each of said power

semiconductor transistors to suppress driving current supplied to one of said at

least two power semiconductor transistors when over current is detected in

current flowing in at least another one of said at least two power semiconductor

transistors connected in series,

wherein said plurality of power semiconductor transistors drive an

ignition coil.

Claim 17 (currently amended): A semiconductor device according to

claim-15, comprising:

an embedded insulation layer formed in a semiconductor substrate;

a plurality of power semiconductor transistors formed on said

semiconductor substrate;

a trench isolating between said plurality of power semiconductor

transistors formed on said semiconductor substrate on said embedded insulation

layer, whereby said plurality of power semiconductor transistors are individually

isolated from each other and, isolated from any other semiconductor transistors;

an isolator insulating and driving control electrodes of said power

semiconductor transistors and including capacitive coupling provided for

transmitting signals between said plurality of power semiconductors transistors;

wherein at least two of said plurality of power semiconductor transistors

are each connected to each other in series; and

a drive circuit for driving a control electrode of each of said power

semiconductor transistors to suppress driving current supplied to one of said at

least two power semiconductor transistors when over current is detected in

current flowing in at least another one of said at least two power semiconductor

transistors connected in series,

wherein said plurality of power semiconductor transistors drive a fuel

injection valve.

Claim 18 (currently amended): A semiconductor device according to

elaim 15, comprising:

an embedded insulation layer formed in a semiconductor substrate;

a plurality of power semiconductor transistors formed on said

semiconductor substrate;

a trench isolating between said plurality of power semiconductor

transistors formed on said semiconductor substrate on said embedded insulation

layer, whereby said plurality of power semiconductor transistors are individually

isolated from each other and, isolated from any other semiconductor transistors;

an isolator insulating and driving control electrodes of said power

semiconductor transistors and including capacitive coupling provided for

transmitting signals between said plurality of power semiconductors transistors;

wherein at least two of said plurality of power semiconductor transistors

are each connected to each other in series; and

a drive circuit for driving a control electrode of each of said power

semiconductor transistors to suppress driving current supplied to one of said at

least two power semiconductor transistors when over current is detected in

current flowing in at least another one of said at least two power semiconductor

transistors connected in series,

wherein said plurality of power semiconductor transistors have an input

control circuit supplying a control signal of a specific control pattern to said

control electrodes of said plurality of power semiconductor transistors on the

base of input signals.

Claim 19 (canceled).
